Belgian Real Estate Market Analysis

Where should a buy-to-let investor put their money?

Preliminary analysis of Belgian real estate market

Objective: Develop a data-driven property valuation model to estimate property prices accurately

Why ?

- Accurately estimating property values is a key strategic advantage
- Reliable price prediction helps :
 - ✓ Identify attractive investment opportunities
 - ✓ Support clients with informed decisions
 - ✓ Improve competitiveness

Preliminary analysis of Belgian real estate market

Objective: Develop a data-driven property valuation model to estimate property prices accurately

Our Approach

- Analysis of thousands of live Belgian property listings
- One practical question: if you have money to invest in property and rent it out, where do you put it and what do you look for?

Meet Marc, a buy-to-let investor

Marc, 45

Private investor · has capital to deploy

- Wants steady monthly income from rent, not a quick flip.
- Open to buying either a house or an apartment.
- Cares most about return on the money he puts in.

Question 1

Where should I buy?

Question 2

What should I look for?

Every insight that follows answers one of Marc's two questions.

The Belgian market at a glance

A snapshot built from thousands of live listings across all 11 provinces.

9,700

Properties for sale

3,800

Properties to rent

11

Provinces covered

2

Types: houses & flats

What makes a property expensive?

How do variables impact price?

THE ELEMENT THAT IMPACTS THE MOST :

Total Habitable Area

The strongest link to price (0.63)

For Marc: pay for space, not the number of rooms.

Every square meter counts : Selling price

+ € 1,956 for houses

+ € 2,185 for apartments

added to the sale price
for every extra m² of living space

Every square meter counts : Rent price

+ € 11/month for houses

+ € 8 /month for apartments

for every extra m² of living space

For Marc:

More surface cost more,
but earn more in rent

Prices swing widely by province

Belgian Property Prices by Location

Circle size = median price per province

Most affordable: Hainaut, Liège, Namur, Luxembourg (Wallonia). **Priciest:** Brussels & the Brabant provinces.

Where rents are highest

Highest rents:

Brussels, Vlaams-Brabant, Brabant Wallon.

Lowest rents:

Hainaut, Luxembourg, Liège.

High rent ≠ best deal.

What matters is rent compared to the purchase price.

Where buy-to-let earns the most

Gross rental yield

= one year of rent ÷ purchase price

Hainaut (~7.6%)

Highest estimated yield
Lower purchase price & Strong rental price

Brabants & Oost/West Vlaanderen (<5%)

Expensive market
Lower returns relative to purchase price

Where money works hardest

Chase yield

For rental income, target Hainaut, Namur and Liège — the highest gross yields in the country.

Buy on usable space

Living space drives both rent and resale. Favor size over number of rooms.

Be mindful of biases

Brussels & Brabant cost the most to buy but yearly yield is not the highest.

Yield isn't the whole story

Gross yield ignores taxes, renovations, etc. Use it to shortlist, then dig deeper.

Thank you
